Format and Verify a Currency String · One complete topic

Format and Verify a Currency String

Original instructional fixture in sources/lesson.md. No course or past-paper provenance is claimed. Generated 17 October 2026.

· How to use this pack

Read the definition and applicable conditions. Follow the worked solution, reproduce its check, and attempt the practice question before reading the answer. Topics include the applicable parts: overview, key terms, formulas, figures, flowcharts, important points, worked examples, past-paper questions and a recap. IDs are shared with the separate documents: E = formula, G = graph, F = flowchart, W = worked example. Each ID is numbered by topic, so E4.2 is the second formula of topic 4.

Contents

1. 1 · Format and Verify a Currency String
2. Appendix A · Symbol glossary
3. Appendix B · Sources, coverage and gaps
4. Appendix C · Revision and retrieval practice

1 Format and Verify a Currency String

Formatting converts a value into a chosen textual representation. This example separates a literal currency symbol from an interpolated value, verifies the exact printed result, and states the limits of a display operation. S1

Key terms and definitions

F-string. A formatted string literal that evaluates expressions inside braces. S1

Format specification. Text after a colon in a replacement field that controls presentation. S1

Formulas

E1.1 · Format two decimal places

```
price = 12
print(f"${price:.2f}")
```

gives	A currency-labelled display string.
applies	Python 3; this is display formatting and no exchange-rate conversion is implied.
units	Display text, not a currency conversion.

S1

Flowcharts

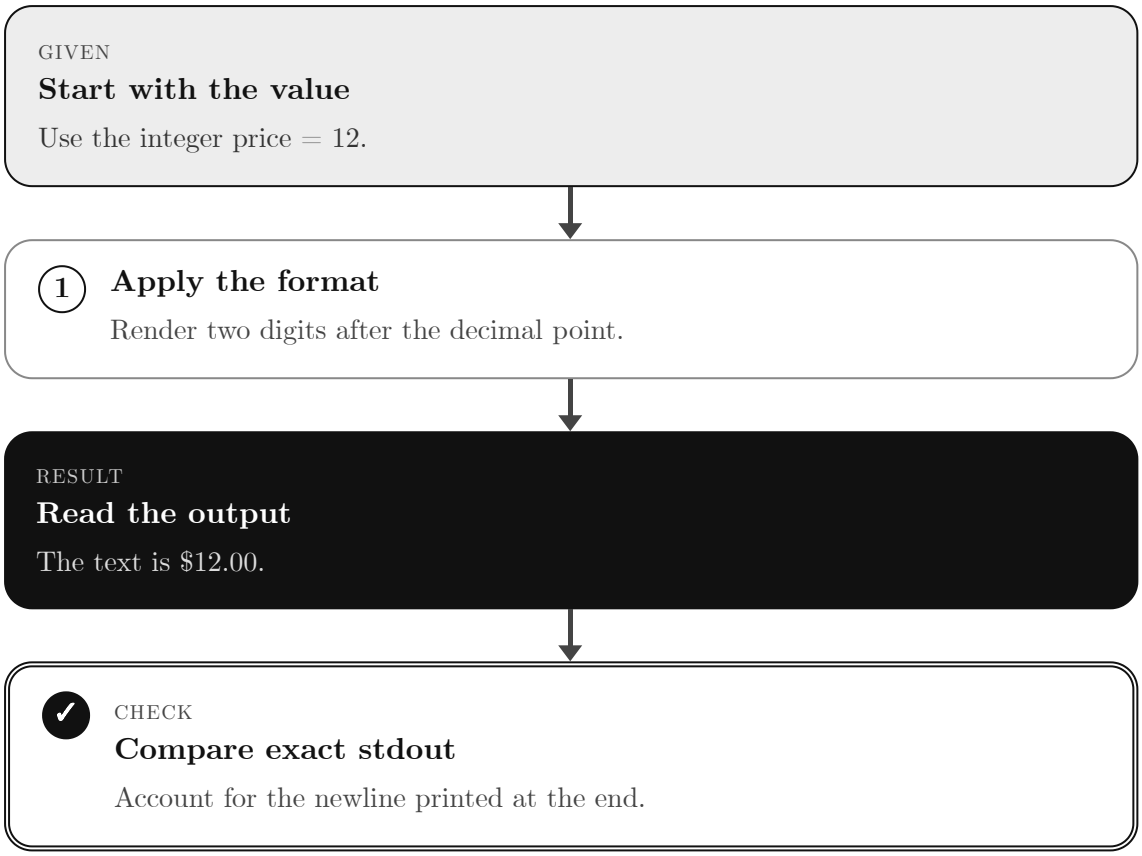

Figure F1.1. Apply and check the method

S1

Important points and why

1. The example formats the integer exactly; it does not claim that floating-point arithmetic is suitable for all financial calculations. S1

Does adding a dollar sign convert a number into another currency?
No. The symbol is a display label. Conversion requires an explicitly supplied exchange rate and a defined calculation.
S1

Worked examples

W1.1 · Predict and verify the exact output

given	The integer price is 12. Execute the two-line example in Python 3.
method	Execute the authored example and compare exact stdout.
step 1	The expression in braces evaluates the integer price.
step 2	The format specification .2f renders two fractional digits. The preceding dollar sign remains literal text.
answer	The output is `$12.00`, followed by a newline.
units	A text string.
check	The example formats the integer exactly; it does not claim that floating-point arithmetic is suitable for all financial calculations.

S1

Practice with explained answers

Q1.1 · Explain a condition before computing

Does adding a dollar sign convert a number into another currency?

S1

Answer · Q1.1

1. No. The symbol is a display label. Conversion requires an explicitly supplied exchange rate and a defined calculation.

Final answer. No. The symbol is a display label. Conversion requires an explicitly supplied exchange rate and a defined calculation.

Check. Check the answer against the explicit assumption in the included lesson.

short-note recap

Formatting converts a value into a chosen textual representation. This example separates a literal currency symbol from an interpolated value, verifies the exact printed result, and states the limits of a display operation.

S1

A Symbol glossary

Symbol	Name	Meaning	Unit	Appears in
`price`	Input variable	The integer 12 in this example. S1	No conversion is performed	E1.1
`f` prefix	Formatted string literal	Evaluates expressions placed inside braces. S1	Python syntax	E1.1
`.2f`	Format specification	Displays two digits after the decimal point. S1	Python syntax	E1.1
$	Literal currency label	An ordinary character outside the expression braces; it does not perform a currency conversion. S1	Display text	E1.1

B Sources, coverage and gaps

Source	Path	Use
Original lesson	sources/lesson.md	All concepts and examples

No past papers supplied; practice is authored and unranked.

Known gaps, conflicts and corrections

Coverage

Every inventoried source unit has an explicit coverage decision. Covered means reviewed and mapped to content; exclusions and gaps remain visible.

Evidence	Source unit	Status	Decision
S1	SRC1/lesson	covered	Read the entire original lesson and mapped definitions, assumptions, examples, limitations and output checks.

C Revision and retrieval practice

Keywords

F-string. A formatted string literal that evaluates expressions inside braces. S1

Format specification. Text after a colon in a replacement field that controls presentation. S1

Rapid recall

Does adding a dollar sign convert a number into another currency? No. The symbol is a display label. Conversion requires an explicitly supplied exchange rate and a defined calculation. S1

Essential facts

The example formats the integer exactly; it does not claim that floating-point arithmetic is suitable for all financial calculations. S1
